Chapter 1

Introduction

1.1 Purpose

The purpose of this document is to provide a complete description of the TrackMe System, through the analysis of the problems, the listing and presentation of the goals, constraints, phenomena, domain assumptions and models with the aim of provide to the stakeholders a complete overview of the project. TrackMe provides three main services: Data4Help, AutomatedSOS and Track4run.

[G1] The Registered User can access to the services offered by TrackMe System with a single account.

[G2] The Registered User can be recognized by providing his/her username and password.

Goals of Data4Help:

[G3.1] Allow a User to manage the accesses to his/her personal data.

[G3.2] Allow a User to visualize his/her actual health parameters and position.

[G3.3] Allow a User to visualize his/her past data history.

[G3.4] Allow a Third Party to send an authorization request to a User for the access to his/her data.

[G3.4.1] Allow a Third Party to request the latest available data of a User.

[G3.4.2] Allow a Third Party to request a subscription to the data of a Users.

[G3.5] Allow a Third Party to request anonymized data of a set of Users.

[G3.5.1] Allow a Third Party to request the latest available data of the set of Users.

[G3.5.2] Allow a Third Party to request a subscription to the data of the set of Users.

[G3.6] Allow a Third Party to visualize the available data through useful statistics.

Goals of AutomatedSOS:

- [G4.1] NHS is alerted when the User gets in a critical state.
- [G4.2] Allow the User to create a list of contacts to be alerted in case of emergency.

Goals of Track4Run:

- [G5.1] Organizers can create a new run.
- [G5.2] Allow a User to enroll to a run as participant.
- [G5.3] Allow a User to visualize the list of scheduled runs.
- [G5.4] Allow a User to visualize the list of live runs.
- [G5.5] Allow a Users to visualize on a map the positions of the participants in a live run.

1.2 Scope

The aim of the project is to develop a software-based application for the company TrackMe that provides three different services: Data4Help, AutomatedSOS and Track4Run. Data4Help collects data of individuals through smartwatches and similar devices. Registered users can visualize their data through useful statistics, while third parties can access data, after authorization, in real time to monitor the location and health status of a single individual, or a set of individuals in an anonymized way. AutomatedSOS offers a personalized and non-intrusive SOS service to people. Based on the data collected by Data4Help, it detects anomalies in the health status of the individual and alerts the NHS, allowing the dispatch of an ambulance as soon as possible. Track4Run is a platform that allows the organization of local runs. Organizers can create a new run, setting a customized path and the related preferences. Users can visualize the planned runs in detail and enroll to them as participants if interested. The service uses Data4Help data to show the position of the participants on a map, allowing all the online users to follow the run live on their devices.

1.3 Definitions, Acronyms, Abbreviations

In this part of the RASD Document there are some definitions, acronyms and abbreviations that will be used among the following chapters.

1.3.1 Definitions

- **Visitor:** when referring to the *Visitor*, we refer to an actor that has not registered to the TrackMe system yet.
- **Registered User:** a user registered to the TrackMe System. All actors must be registered to the system in order to perform any action on it.
- **Logged-in User:** a registered user who has logged into the TrackMe System
- **User:** when referring to the *User*, we refer to a logged-in user which is not a Third party.

- **Organizer:** referring to a run of the Track4Run service, the logged-in user that has created it
- **System /TrackMe System:** the entire system infrastructure, encompassing the Data4Help, AutomatedSOS and Track4Run services.
- **Health data:** data collected by user's smart device which refer to his/her health status
- **Request:** performed by a Third Party, a request asks the permission to get access to some specific user data. There are 4 types of requests:
 - *One-shot User requests* concern the latest available data of a single user
 - *Subscription User requests* provide the Third Party with regular updates of the user data
 - *One-shot Group requests* concern the latest available data of a specific set of users
 - *Subscription Group request* provide the Third Party with regular updates of the group data

In a request, the Third Party can specify the type of data it wants to receive, with a choice among different health data (heart rate, blood pressure, step counter, etc.). User requests must be accepted by the user to be performed, while group requests are automatically active if the selected set of individuals is greater than 1000 users.

- **Run:** sports event organized with the Track4Run System. Scheduled runs are runs that have been created in the system and will take place in the future, while Live runs are those which are taking place at the moment and can be watched live.
- **Path:** route that the participants of a run will follow during the event. It is selected by the run organizer during the event creation (start point, intermediate points and final point)

1.3.2 Acronyms

- R.A.S.D.: Requirements Analysis and Specifications Document
- A.P.I.: Application Programming Interface
- N.H.S.: National Health Service
- S.M.S.: Short Message Service

1.3.3 Abbreviations

- [G k]: The k-th goal
- [D k]: The k-th domain assumption
- [R k]: The k-th functional requirement

1.4 Document Structure

This document is divided into 5 sections:

- Introduction

It includes a general overview on the System, its goals and all the information useful to better understand the other sections of the document.

- Overall Description

It includes the models of the System: UML, shared phenomena and state charts; the domain assumptions and constraints, the requirements associated to each goal and a reference to the users of the application.

- Specific Requirements

This is the main body of the document. It contains: the *external interface requirements*, which include the mockup of the application, both mobile and web; the *functional requirements*, with all the scenarios and the use cases of the main functionalities, with the aim of describing how the application will work; the *performance requirements*; all the design constraints; finally, the software system attributes.

- Formal Analysis

This section contains the Alloy model of our System, with proofs of correctness of the more relevant assertions and predicates.

- Effort Spent

A brief overview on the effort spent by each component of the group.

1.5 Reference Documents

- Specification documents: *Assignments AA 2018-2019.pdf*

- 29148-2011 - ISO/IEC/IEEE International Standard - Systems and software engineering – Life cycle processes –Requirements engineering

- Alloy Language Reference

1.6 Used Tools

The tools used to develop this document are:

- GitHub

- Overleaf

- Git

- SourceTree

- draw.io

- Sketch

- Notability
- Alloy

1.7 Revision History

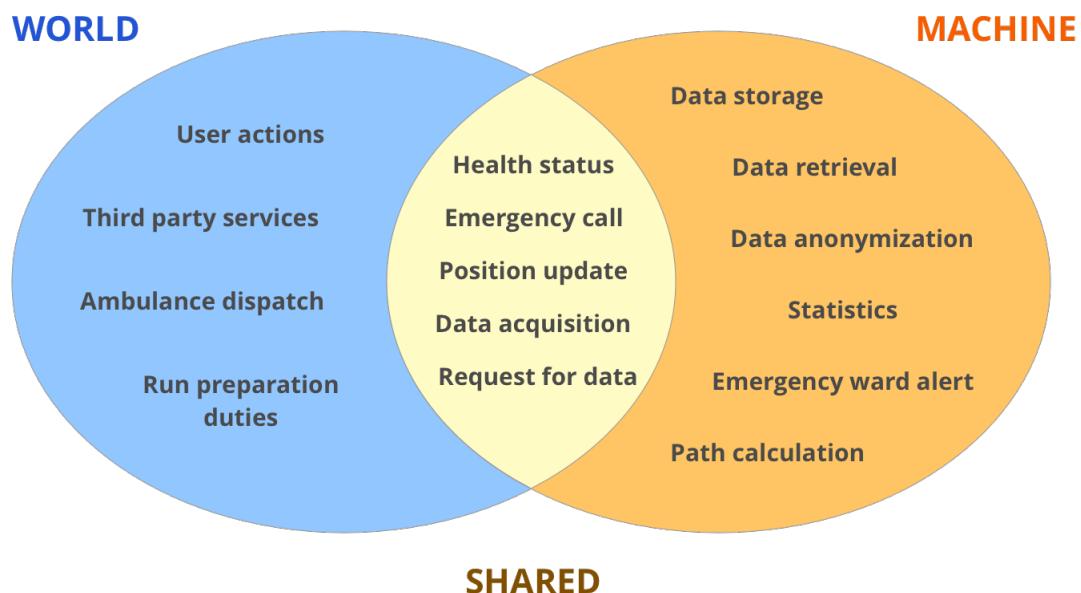

- Version **1.0** (11 November 2018)
- Version **1.1** (2 December 2018)
 - Removed unnecessary requirement
 - General formatting improvements

Chapter 2

Overall Description

2.1 Product Perspective

2.1.1 The world and the Machine

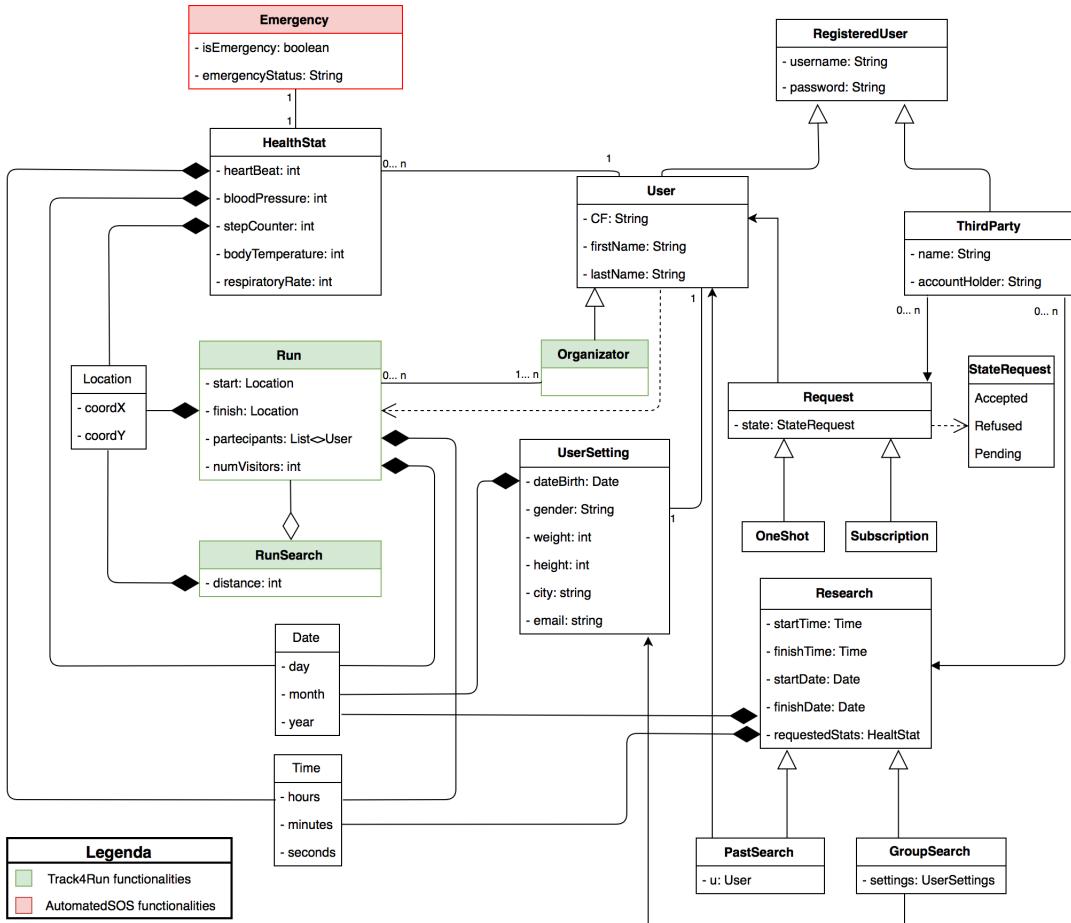

Some clarifications about the diagram:

The User actions refer to all the behaviours the user performs in the every day life. The Third Party services are all the services that will arise from the utilization and the study of the collected data. The Run preparation duties are the efforts spent planning and organizing a run event projected in the real world (e.g. block the circulation of vehicles in certain streets). The Emergency ward alert represents the background service that the machine performs to check the health status of the users with AutomatedSOS enabled. If an anomalous state is detected, the Emergency procedure is triggered.

2.1.2 UML: Class Diagram

This is the UML model of the whole system, based on a class diagram:

2.1.3 State charts:

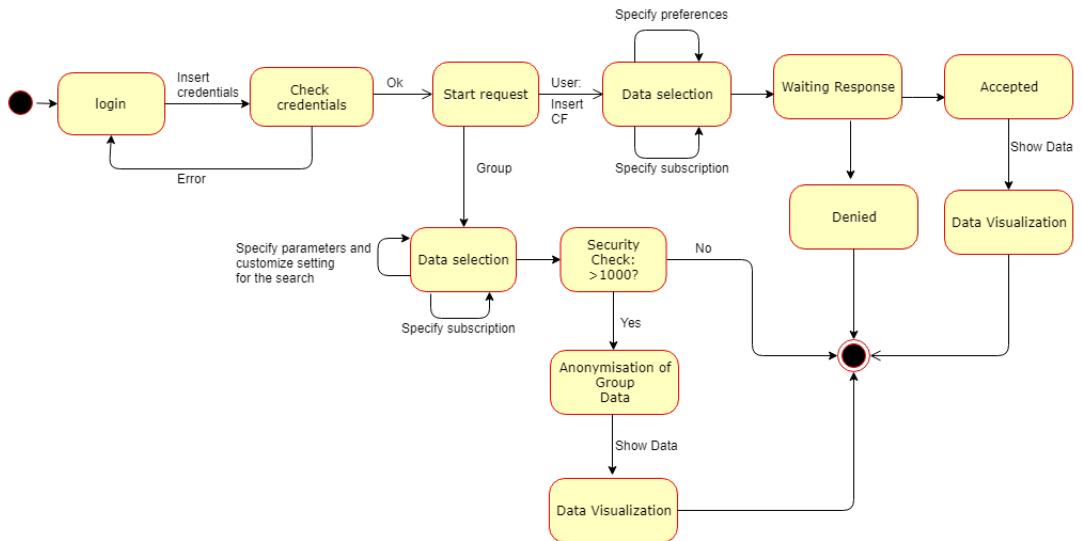

Figure 2.1: State chart of *Data4Help* System

This is a background service that runs in order to keep track of the health status of each user, and notify the NHS in case of Emergency.

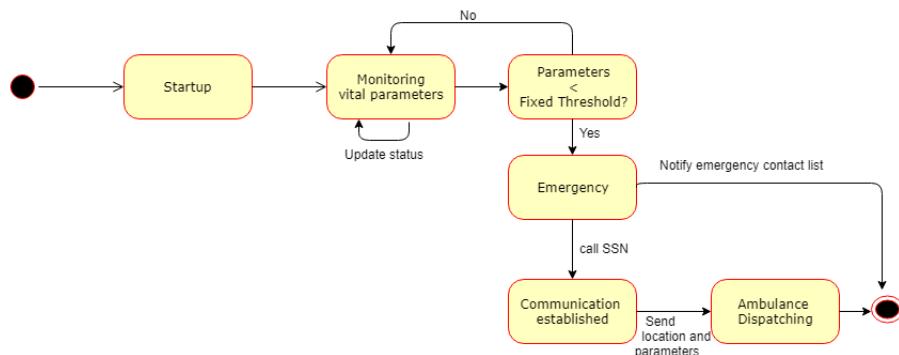

Figure 2.2: State chart of *AutomatedSOS* System

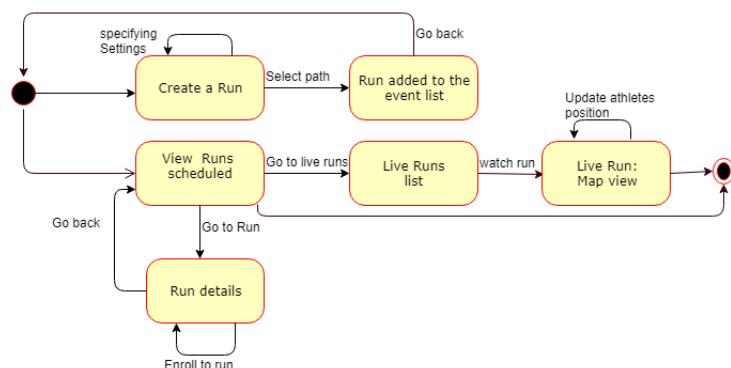

Figure 2.3: State chart of *Track4Run* System

2.2 Product Functions

Here we list the main requirements to be satisfied by the *TrackMe* system, each with respect to the associated goal.

[G1] The Registered User can access the services offered by TrackMe System with a single account.

- R1) The User accesses the System only through the mobile application.
- R2) The User can access all the three services: Data4Help, AutomatedSOS and Track4Run.
- R3) The Third Party accesses the System only through the web application.
- R4) The Third Party can access only the Data4Help service.
- R5) The User can decide to keep AutomatedSOS's service active or deactivate it arbitrarily.

[G2] The Registered User can be recognized by providing its username and password.

- R6) The User must specify his/her personal data at registration time: first name, last name, fiscal code, age, city, weight and height.
- R7) The Third Party have to specify its personal data at registration time: company name, account holder, VAT number, address.

Data4Help:

[G3.1] Allow a User to manage the accesses to his/her personal data.

- R8) The User receives requests on his/her data from Third Parties in real time.
- R9) The Request can be accepted or denied by the User.
- R10) The User can see the specific type of data requested from the Third Party.

[G3.2] Allow a User to visualize his/her actual health parameters and position.

- R11) The User must be able to see its position on an interactive map.
- R12) The position must be updated in real time.

R13) The System provides the latest health and location data available.

[G3.3] Allow a User to visualize his/her past data history.

R14) The System asks the User what kind of data he/she wants to see.

R15) The data are presented in the order specified by the User.

R15.1) The System provides two grouping options: time and location.

R16) A manual research on the personal data history can be performed by the User.

R16.1) The User can customize its search specifying the time or location range.

[G3.4] Allow a Third Party to send an authorization request to a User to access his/her data.

R17) The System asks to insert the fiscal code of the specific User.

R18) The Third Party is asked to specify the type of data to be requested.

R19) The System notifies the User about the request from the Third Party.

R20) The System notifies the Third Party as soon as the response to their request is available.

[G3.4.1] Allow a Third Party to request the latest available data of a User.

R21) If the request is accepted by the User, the System will provide the Third Party with his/her latest available data.

[G3.4.2] Allow a Third Party to request a subscription to the data of a Users.

R22) The Third Party can define the interval between updates for each specific parameter.

R23) If the request is accepted by the user, the system will provide the Third Party with periodic updates.

[G3.5] Allow a Third Party to request anonymized data of a set of Users.

R24) The Third Party is asked to specify the type of data to be requested.

R25) The data requested will be chosen among those that match the preferences specified by the Third Party: age range, geographical area, localization, gender, weight, height.

R26) The data will be anonymized to prevent the possibility of a misuse of data.

[G3.5.1] Allow the Third party to request the latest data of the set of Users.

R27) If the request is allowed, the System will provide the Third party with its latest available data about group.

[G3.5.2] Allow a Third Party to request a subscription to the data of the set of Users.

R28) The Third Party can define the interval between updates for each specific parameter.

R29) If the request is allowed, the System will provide the Third Party with periodic updates about the group.

[G3.6] Allow a Third Party to visualize the available data through useful statistics.

R30) The System provides the Third Party with different graphical representations of the available data.

AutomatedSOS:

[G4.1] NHS is alerted when the User gets in a critical state.

R31) The System continuously keep track of the vital parameters of the User.

R32) The System communicates the health status of a User to the NHS when his/her parameters exceed certain thresholds.

R33) The System calls the emergency number, communicates the vital parameters and the actual location of the User, and asks for the dispatch of an ambulance.

[G4.2] Allow the User to create a list of contacts to be alerted in case of emergency.

R34) The system sends a message to all the numbers on the specified list in case of emergency.

R35) The user can customize the text message to be sent.

R36) If there is not a customize text message, the system will send a default message.

Track4Run:

[G5.1] Organizers can create a new run.

R37) The System asks the Organizer to select a starting and finishing point for the run.

R38) The Organizer can add intermediate points that will be part of the path.

R39) The System relies on an external service to provide the interaction with a map.

R40) The System calculates the shortest path that includes all the points selected by the Organizer.

R41) The System asks the Organizer to specify the maximum number of participants.

R42) After being created, the run is added to the list of the scheduled runs.

[G5.2] Allow a User to enroll to a run as participant.

R43) The System allows to enroll to a run if there are available entries.

R44) The System sends an email to the User's email address with the information related to the run and the ticket (with the bib number).

R45) The User is notified if there are changes until the day of the run by means of email updates.

[G5.3] Allow a User to visualize the list of scheduled runs.

R46) The System shows only future scheduled runs.

R47) A manual search can be performed by the User by specifying the location range and the minimum/maximum distance.

R48) The System provides the list of scheduled runs ordered by time and User's location.

[G5.4] Allow a User to visualize the list of live runs.

R49) The list of live runs shows only the list of runs that are taking place in that moment or that are already started.

R50) The User can decide to follow a live run from the list, directly from their device.

[G5.5] Allow a User to visualize on a map the positions of the participants in a live run.

R51) The positions on the map are updated in real time.

R52) The System shows the number of online visitors that are watching the run.

2.3 User characteristics

The main registered users of Data4Help are third parties interested for various purposes in collecting and analyzing of user's data. Users are people of all kinds, who want to keep track of their data in time and take advantage of the services derivative from the analysis of their own data. The users of AutomatedSOS are people who decide to rely on this service essentially for a security factor, to be assisted in case of emergency.

The user of Track4Run are sports lovers who concerned in planning, partecipating and follow live runs streaming on Internet, directly from their devices everywhere.

2.4 Assumptions, dependencies and constraints

Domain Assumptions:

- [D.1] The user owns a smart device connected to his/her smartphone.
- [D.2] The smart device collects the data through its sensors.
- [D.3] The device has regular internet connection.
- [D.4] The device has a working GPS system.
- [D.5] The GPS position has an accuracy of less than 5 mt.
- [D.6] An external map service will be used.
- [D.7] The map service is reliable.
- [D.8] Only registered users, either as third party or clients, can use the application.

- [D.9] At registration time, the user provides correct data: fiscal code, first name, last name, age, city, email, height and weight.
- [D.10] At registration time, the third party provides correct data: account holder, VAT number, address and email.
- [D.11] The device's sensors send new data at least every 5 seconds.
- [D.12] After the start of an emergency, an ambulance will be dispatched at the user's location as soon as possible.
- [D.13] For every urgent call, details about the emergency are correctly encoded.
- [D.14] The threshold value for emergency detection is provided by a trusted medical authority.
- [D.15] The map service provides only feasible paths accessible by foot.

Constraints:

1. A group request can be executed only if there are at least 1000 users that match the requested characteristics.
2. From the time the parameters exceed a fixed threshold, the communication with NHS must be established within 5 seconds.
3. The subscription to a run is closed if the maximum number of participants is reached.
4. The mobile application must be able to store the data collected by the smart device, so that new data can be sent with a frequency that is lower than the one by which new data are generated. This ensures no loss of data in case of missing internet connection, as well as a lower battery consumption.

3.1.2 Hardware Interfaces

The system requires users to own a smart device capable of measuring health parameters and a smartphone provided with an internet connection and GPS. The system needs one or more dedicated servers.

3.1.3 Software Interfaces

The system will need:

- A client database to store data in the User's device, so that in case of lack of connection the data are not lost.
- A server database that will store the User data history and allow to retrieve the data through queries.
- A mobile application that will be downloaded on the User's devices (both on smart-watch and smartphone).
- A web application usable in a modern browser that provides access to TrackMe services for the Third Party.

3.1.4 Communication Interfaces

The communication between the client application and the server will be provided by a custom-built API. The connection will follow the HTTPS protocol. The various users' smartdevices can communicate with each other through Bluetooth connection.

3.2 Functional Requirements: Use Cases and Scenarios

3.2.1 Scenarios:

Scenario A

Tom is a middle age man who wants to keep an healthy lifestyle. He wants to go to work on foot and walk at least 10000 steps for day. With the TrackMe System, he can visualize his actual and past health data, with the possibility to check if he reached his daily goal.

Scenario B

Happy Company is a medical association registered as a Third Party to the TrackMe System. It exploits the Data4Help service to offer a new service to their patients which already use the TrackMe app. The patients that accept the company's subscription request about health data are monitored daily, and the collected data are stored in their personal medical records. During the examinations, the data are consulted by the doctors to complement the medical records of the patients.

Scenario C

Data Corporation is a company interested in huge amount of data to make statistical analysis on different sets of individuals, based on different parameters, such as age range, gender, city, etc. It is registered to the TrackMe System as a Third party and uses the System as an useful database to query for its purposes, performing periodically anonymous researches on groups and studying the collected data.

Scenario D

John is an elderly man with hearth disease who is walking in the street. He is going to buy the newspaper like every morning. John has received a smartwatch as Christmas gift from his son. His son has already managed to download the TrackMe application, register his father to the TrackMe system and enable the AutomatedSos service. Moreover, he added himself as emergency contact, in order to be alerted in case of emergency. Suddenly John feels bad and falls to the ground. The sensors of his smartwatch detect an anomalous health status, probably an heart attack, and AutomatedSOS starts the Emergency procedure: calls the emergency number of the NHS, communicates the location and the health status of John and asks for the dispatch of an ambulance. His son is notified. The ambulance arrives as soon as possible and the doctors take care of him.

Scenario E

The mayor of an Italian city wants to organize a city run. She decides to manage the event with Track4Run. The interested citizens can sign up to the run through the enroll function. She selects the day and the time of the event, a path of 10 km that includes all the main points of interest of the city and sets the maximum number of participants to 2000. The entries are soon sold out and the run is a successful event. The Mayor then decides to organize the event every year.

Scenario F

Steve loves sports. He is far from home for a business trip, but he knows that on that day a run will take place, organized by the mayor of his city with the Track4Run System. He downloads the TrackMe app and, at the starting time, selects the run from the live

run list and follows it comfortably from his device.

3.2.2 Registration and Login System

Every visitor who wants to use the application must register to the System. After the registration, the Registered User must log into the System to use the mobile/web application.

Actors	Visitor Registered User Logged-In User
Goals	[G1] [G2]
Enter Condition	There is no enter condition for this Use Case
Events Flow	<ol style="list-style-type: none"> 1. The <i>Visitor</i> accesses the web site or application sign-up page. 2. The <i>Visitor</i> inserts all the mandatory informations (username that will identify the user and password, personal data, email). 3. The System registers the new Registered User and sends a confirmation email to the provided email address. 4. The <i>Visitor</i> becomes a <i>Registered user</i> inserting a unique username and the password in the log in page. 5. The <i>Registered User</i> now can access the <i>TrackMe</i> services through the log in page. 6. After the insertion of the identifier and password, the <i>Registered User</i> becomes a <i>Logged-in User</i>.
Exit Condition	The User/Third Party is registered in the <i>TrackMe</i> System, and his account is added to they system. Now the Registered User is able to use all the functionalities provided by the system.
Exception	<ol style="list-style-type: none"> 1. The <i>Visitor</i> cannot register himself because he is already registered. 2. The <i>Registered User</i> is not able to sign into the System because the login data are wrong or he did not confirm the registration. <p>If one of these problems occur, the system, both on the web site and on the mobile application, shows a message error to the User/Third Party, which is invited to re-insert their credentials or confirm the registration email.</p>

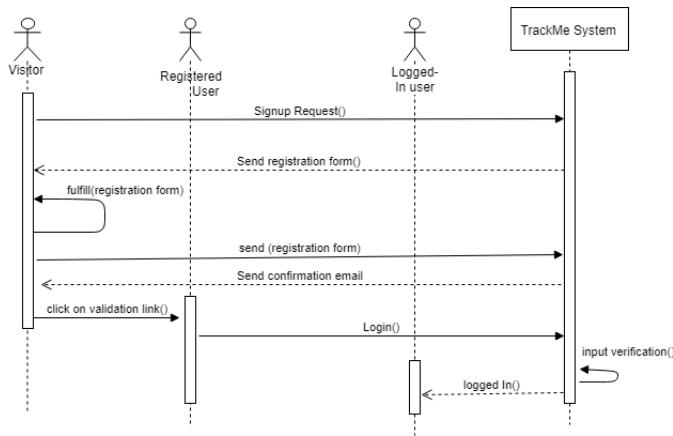

Figure 3.17: Sequence diagram for the registration and login process

3.2.3 Request of selected data of a specific user with subscription and data visualization

The Third Party uses the Data4Help System by sending a request for some data (health data and location) of a specific User, either the last available data, or in subscription mode. In the latter case, it inserts the interval time between each update. The User can manage its requests and decide to accept or deny them. If the request is authorized, the Third Party receives the requested data from the System, according to the chosen modalities.

Actors	Third Party User
Goals	[G3.1] [G3.4] [G3.4.1] [G3.4.2] [G3.6]
Enter Condition	The Third Party is already logged in.
Events Flow	<ol style="list-style-type: none"> 1. The <i>Third Party</i> selects the Individuals section. 2. The <i>Third party</i> presses the "New Request" button. 3. The <i>Third party</i> inserts the specific fiscal code of the target User. 4. The <i>Third party</i> specifies the data that want to receive. 5. The <i>Third Party</i> can select the subscription mode. If it is chosen, the <i>Third Party</i> should also specify the interval time between each update. 6. The System sends an authorization request to the target User with all the related informations. 7. The <i>User</i> receives the request in his "Inbox" section and can decide to accept or deny it. 8. If the request is accepted, the System retrieves the requested data. (If the <i>Third Party</i> has performed a subscription request, the System sends the updates to the <i>Third Party</i> according to the interval specified before). 9. The requested data are shown to the <i>Third Party</i>.
Exit Condition	The Third Party can examine the requested data.
Exception	<ol style="list-style-type: none"> 1. The target <i>User</i> denies the request: the negative response is communicated to the <i>Third Party</i>. 2. The selected fiscal code does not correspond to a <i>User</i>: the System asks to insert another fiscal code.

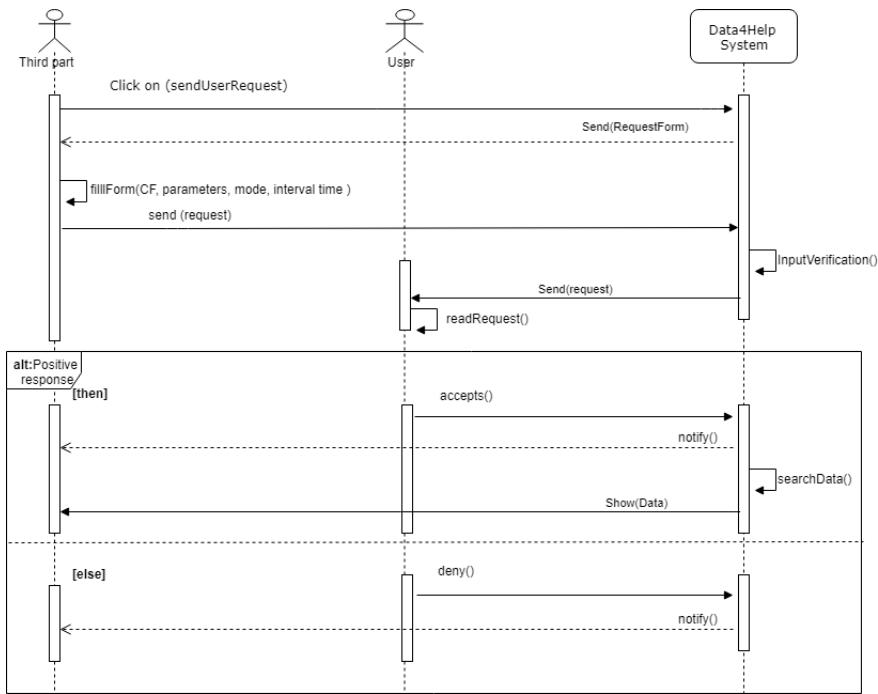

Figure 3.18: Sequence diagram for requesting data of a specific User

3.2.4 Group Request

The Third Party can make a request for anonymized data by specifying the constraints of the group, the data it wants to retrieve and, optionally, the subscription mode with the interval time of updates. The anonymized group data are shown to the Third Party only if the privacy constraints are respected (there must be a number of at least 1000 users that match the specified constraints).

Actors	Third Party
Goals	[G3.5] [G3.5.1] [G3.5.2] [G3.6]
Enter Condition	The Third Party is already logged in.
Events Flow	<ol style="list-style-type: none"> 1. The <i>Third Party</i> selects the Group section. 2. The <i>Third Party</i> selects the "New Request" button. 3. The <i>Third Party</i> specifies the group constraints (such as city or location, the age interval, gender, height and weight). 4. The <i>Third Party</i> selects the data it wants to retrieve and, if it has chosen the subscription mode, specifies the interval time for the updates. 5. Finally, the <i>Third Party</i> sends the request, selecting the "Send" button. 6. If the privacy constraints are respected, the System sends the requested anonymous data to the <i>Third Party</i>.
Exit Condition	The Third Party can visualize the anonymized data related to the specifications given.
Exception	<ol style="list-style-type: none"> 1. The <i>Third Party</i> specified an nonexistent city or location. 2. The <i>Third Party</i> specified an impossible age/height/weight range. 3. In subscription mode, the <i>Third Party</i> hasn't specified an update interval time. 4. The <i>Third Party</i> hasn't specified the data that wants to retrieve. <p>If one of these problems occur, the System shows a error message to the Third Party, which is invited to re-insert the data or to specify the missing data.</p>

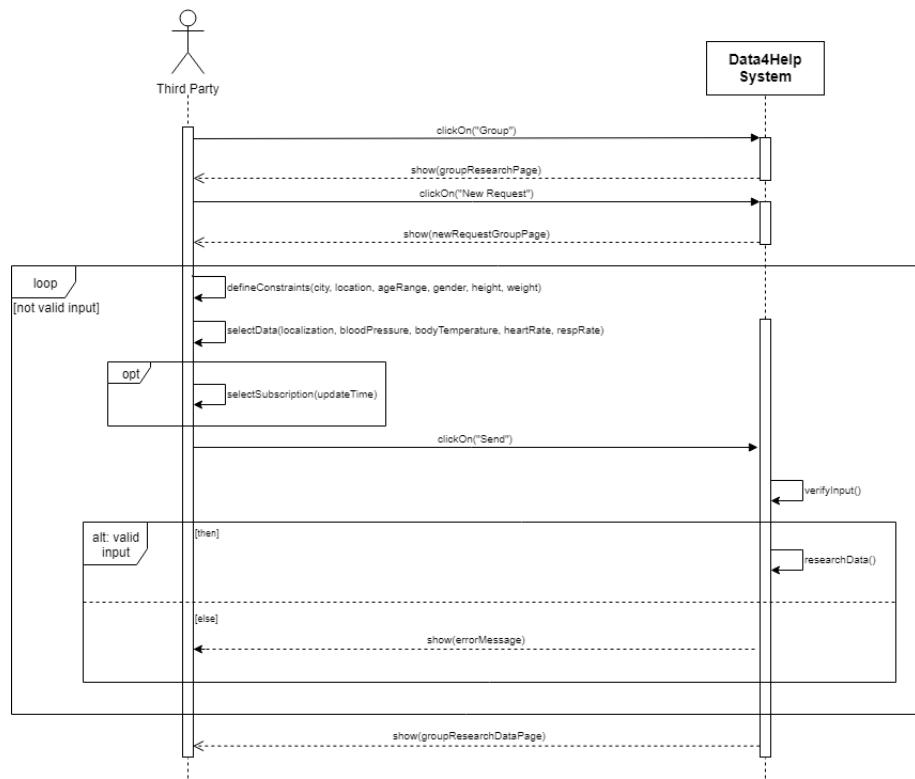

Figure 3.19: Sequence diagram for anonymized group request performed by a Third Party

3.2.5 A User visualizes its past data through a customized research

The User can access to its past data stored in the system, specifying the interval time of interest or the location in which the data were collected. If the User does not insert any preference, all the available data are shown. The data can be visualized ordered by time or by location (e.g. the health data collected when the User was in the city of Milan).

Actors	User
Goals	[G3.3]
Enter Condition	The User should be logged in.
Events Flow	<ol style="list-style-type: none"> 1. The <i>User</i> presses the "My Data" button. 2. The System asks to specify what kind of parameters he wants to see. 3. The <i>User</i> specifies the parameters of the data that wants to visualize. 4. The <i>User</i> can specify the time or the location range. 5. The System retrieves the informations requested from the database. 6. The System shows the data to the user. 7. The <i>User</i> selects the visualization order(time or location order). 8. In case of localization data, the <i>User</i> can view them more in detail on an interactive map pressing on the map button.
Exit Condition	The User can examine the requested data.
Exception	<ol style="list-style-type: none"> 1. The requested data do not exist in the database. <p>In this case the System shows an error message and invites the User to insert consistent preferences.</p>

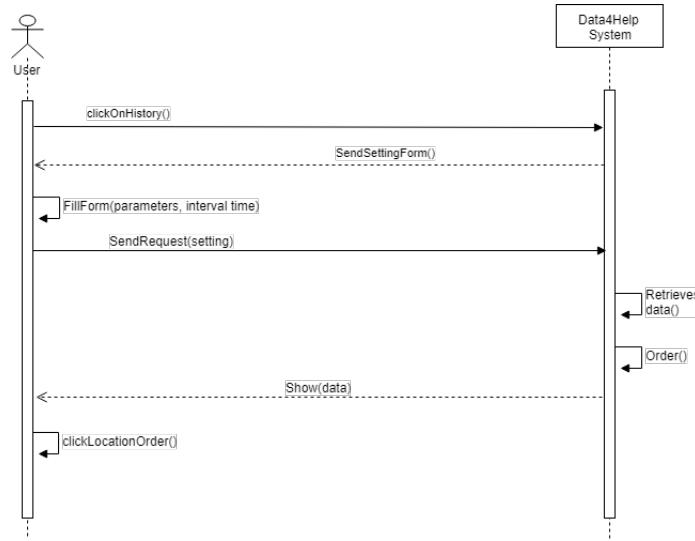

Figure 3.20: The User performs a history search on its personal data by specifying an interval time and visualizes them in location order

3.2.6 Emergency call

The system detects an emergency, calls the NHS and sends a text message to the contacts that are present in the emergency list.

Actors	NHS
Goals	[G4.1]
Enter Condition	The latest health data retrieved from the smart device exceed the critical parameters.
Events Flow	<ol style="list-style-type: none"> 1. The System creates a basic diagnosis based on the anomalous parameters. A text-to-speech algorithm generates the audio file from the diagnosis and the localization of the User. 2. The System calls the <i>NHS</i> emergency number and request the dispatching of an ambulance. 3. The System sends a text message (SMS) to the contacts from the emergency list.
Exit Condition	A call to the <i>NHS</i> is performed by the System.
Exception	

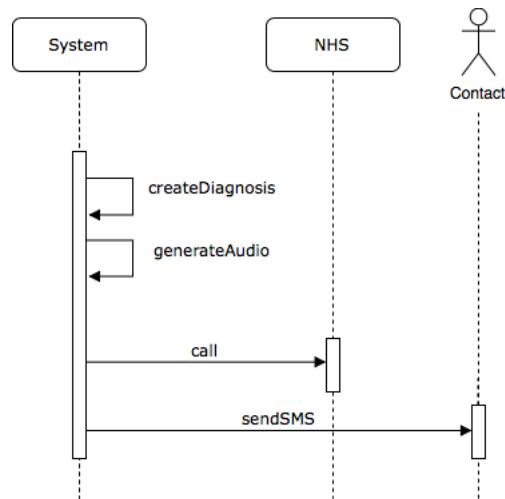

Figure 3.21: Sequence diagram for the occurrence of an emergency status

3.2.7 Create a new run

Every User can create a new run, specifying the start and finish locations, date, time and the maximum number of enrollments.

Actors	Organizer
Goals	[G5.1]
Enter Condition	The Organizer is already logged in.
Events Flow	<ol style="list-style-type: none"> 1. The <i>Organizer</i> accesses the "Create Run" page of the application. 2. The <i>Organizer</i> inserts all the required information to define the run (start and finish locations, date, time and maximum number of participants). 3. The <i>Organizer</i> defines the list of intermediate locations that will be part of the run's path (optional) 4. The System adds the new run to the list of scheduled runs.
Exit Conditions	The new run is created and successfully added to the list of scheduled runs.
Exceptions	<ol style="list-style-type: none"> 1. The <i>Organizer</i> specified points that are not reachable on foot. 2. The <i>Organizer</i> specified a negative maximum number of participants. 3. The <i>Organizer</i> specified a date or time which belongs to the past. 4. The <i>Organizer</i> specified a run with all the same informations of another run. <p>If one of these problems occur, the system shows an error message to the user, which is invited to insert the required information again.</p>

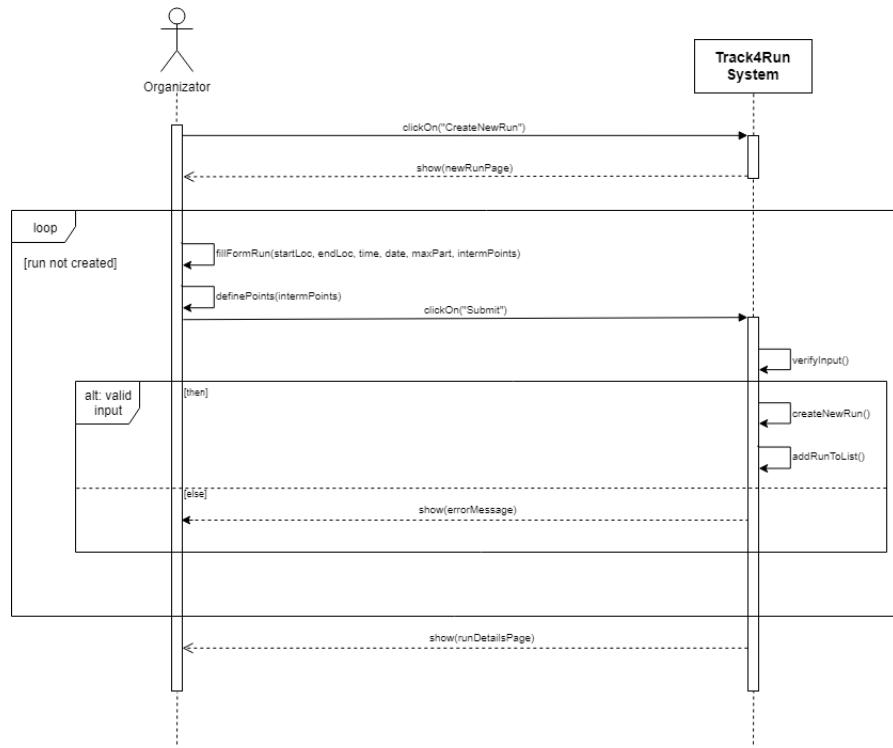

Figure 3.22: Sequence diagram for creating a new run

3.2.8 Enroll to a scheduled run

After visualizing the list of scheduled runs, the User can choose one of them and, if entries are still available, can enroll to the selected run.

Actors	User
Goals	[G5.2]
Enter Condition	The <i>User</i> has already visualized the list of scheduled runs.
Events Flow	<ol style="list-style-type: none"> 1. The <i>User</i> chooses a run from the list of scheduled runs. 2. The System shows the details relative to the selected run. 3. The <i>User</i> enrolls to the selected run by with the "Enroll" button. 4. If there are available, the System adds the <i>User</i> to the list of participants of the run. 5. The System sends an email with all the informations about the run to the User's email address. 6. The System notifies the <i>User</i> through email updates in case of scheduling changes before the day of the run.
Exit Conditions	The User is enrolled to the run and added to the list of participants of the chosen run.
Exceptions	<ol style="list-style-type: none"> 1. The <i>User</i> tried to enroll to a run that has no more available entries. <p>If this problem occurs, the system shows an error message to the user, which is invited to choose another run.</p>

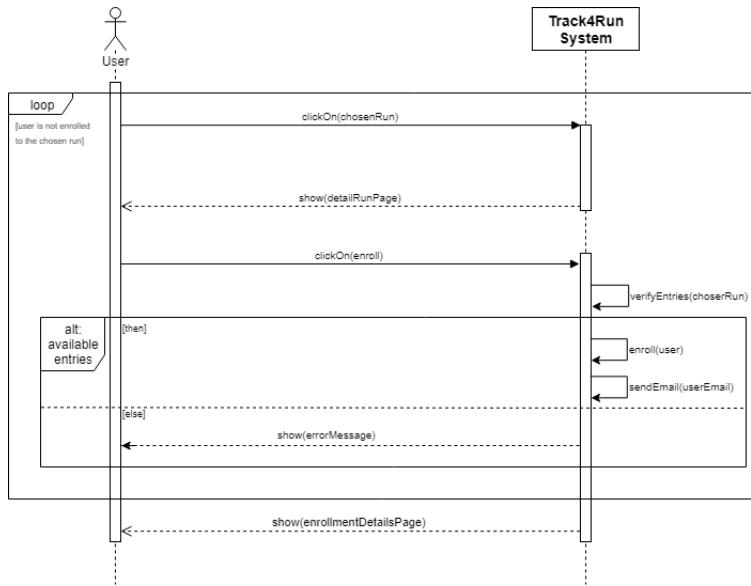

Figure 3.23: Sequence diagram for the enrollment of a user to a scheduled run

3.2.9 Visualize the list of scheduled runs

In the *Track4Run* view, a User can perform a search specifying the characteristics (location range and minimum/maximum distance) of scheduled runs. The System will show the list of scheduled runs that meet the User's specifications.

Actors	User
Goals	[G5.3]
Enter Condition	The <i>User</i> is already logged in.
Events Flow	<ol style="list-style-type: none"> 1. The <i>User</i> selects the "Search" button on the <i>Track4Run</i> view. 2. The <i>User</i> specifies the characteristics of the run that he/she wants to visualize(if not specified, the System will show all the scheduled runs). 3. The System shows the list of scheduled runs that meet the required features.
Exit Conditions	The list of scheduled runs that correspond to the choice of the User is shown.
Exceptions	There are no exceptions.

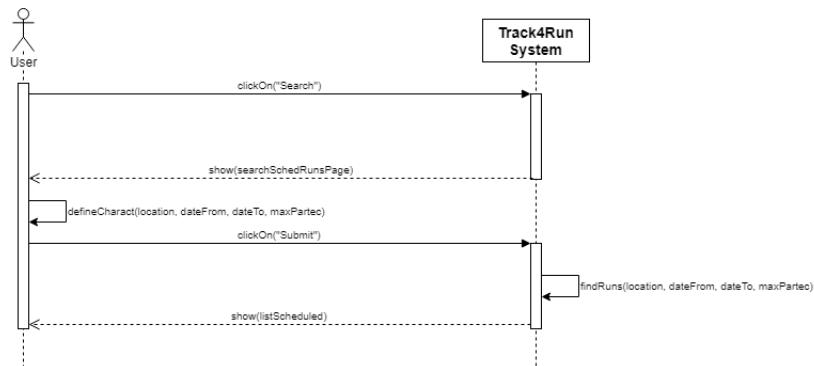

Figure 3.24: Sequence diagram of the search and visualization of the list of scheduled runs

3.2.10 Visualize the list of live runs

In the *Track4Run* view a User can visualize the list of live runs that can be followed online.

Actors	User
Goals	[G5.4]
Enter Condition	The <i>User</i> is already logged in.
Events Flow	<ol style="list-style-type: none"> 1. The <i>User</i> selects the "Live Runs" button from the <i>Track4Run</i> view to visualize the list of live runs. 2. The System shows the list of all the available live runs.
Exit Conditions	The list of live runs is shown.
Exceptions	There are no exceptions.

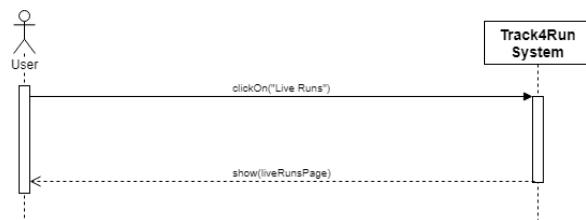

Figure 3.25: Sequence diagram for the visualization of the list of live runs

3.2.11 View a live run

A User can view a run live through the mobile application, visualizing a map with the location of each participant.

Actors	User
Goals	[G5.5]
Enter Condition	The User has already visualized the list of live runs.
Events Flow	<ol style="list-style-type: none"> 1. The <i>User</i> selects the run to be followed live. 2. The System shows the details about the run (location, date, time, number of participants, number of spectators). 3. The <i>User</i> can select the 'View Live' button to visualize the map of the run and the live location of each participant. 4. The System shows the map with the participants locations and increments the number of online spectators.
Exit Conditions	The User visualizes the run and the number of online spectators.
Exceptions	There are no exceptions.

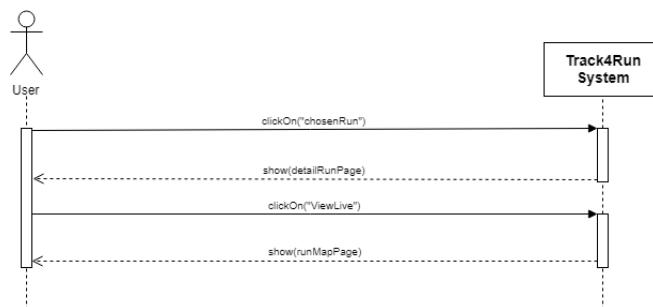

Figure 3.26: Sequence diagram for the view of live run

3.2.12 Use Case Diagrams:

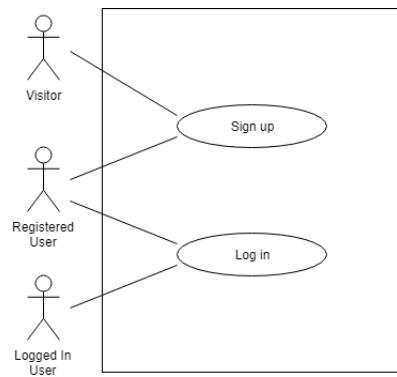

Figure 3.27: Visitor's Use case of *TrackMe* System

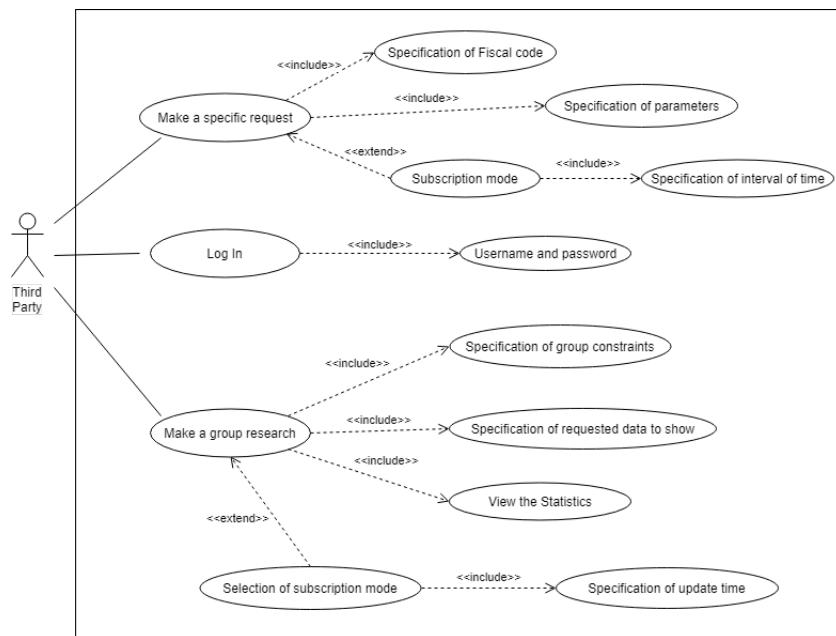

Figure 3.28: Third Party's Use case of *TrackMe* System

Figure 3.29: User's Use case of *TrackMe* System

3.3 Performance Requirements

The application should be able to serve a big number of users simultaneously for the collection and research of data with the fastest response possible. It should be flexible to respond to different demands of workload. The application should provide a seamless user interaction, with the minimum amount of lag and stuttering.

3.4 Design Constraints

- The mobile application will be available for iOS (from 10.3.3) and Android (from 6.0) operating systems. The web application can be browsed with any modern browser.
- Connectivity:
 - 2G, 3G, 4G
 - GPS

3.5 Software System Attributes

3.5.1 Reliability

TrackMe guarantees a service that is continuous in time. AutomatedSOS must guarantee a 24h per day and 7 days per week service, since this is an emergency service and should monitor the health status of each user continuously to detect the occurrence of an emergency.

3.5.2 Availability

Our system will provide an availability of 99.75%, with a downtime of about 8.73 hours/year.

3.5.3 Security

Through the HTTPS protocol we guarantee a secure communication between the clients and the server. User personal data are encrypted to protect against unauthorized accesses. The use of salting will be supported.

3.5.4 Maintainability

The system will be modular and extensible to make it more maintainable and stable in case of future updates or introduction of new software applications that can be integrated with the system.

3.5.5 Portability

The mobile app will support the two main mobile operating system (iOS and Android). The web app will be available on any modern browser.

Chapter 4

Formal Analysis

Here we present a possible formal model for the TrackMe system. The model is built using the Alloy specifications.

We modeled mainly the Data4Help and Track4Run services, with just a small part dedicated to AutomatedSOS. In the intent not to overwhelm the model with numerous signatures and attributes, some features of the system have been left out and we focused on the request management, the run organization and the anonymity of data in group requests. In particular, we modeled an anonymous identifier that permits the identification of a user in a group without accessing its personal information.
